LAB REPORT

on

Artificial Intelligence (23CS5PCAIN)

Submitted by

Thrisha D (1BM24CS426)

in partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING

in

COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

BENGALURU-560019

Aug 2025 to Dec 2025

B.M.S. College of Engineering,
Bull Temple Road, Bangalore 560019
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled “Artificial Intelligence (23CS5PCAIN)” carried out by **Thrisha D (1BM24CS426)**, who is bonafide student of **B.M.S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Artificial Intelligence (23CS5PCAIN) work prescribed for the said degree.

Sonika Sharma D Assistant Professor Department of CSE, BMSCE	Dr. Kavitha Sooda Professor & HOD Department of CSE, BMSCE

Program 1

Implement Tic-Tac-Toe Game Implement
vacuum cleaner agent

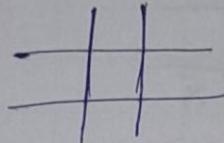

Algorithm:

step 10 : ask for player to play again if there any chance
to win

step 11 : end

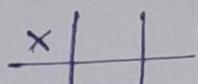

Output :-

Player X's turn

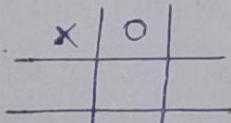

Enter row (1, 2, or 3) : 1

Enter column (1, 2, or 3) : 1

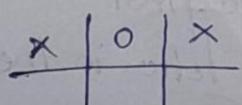

Player O's turn
row : 1

column : 2

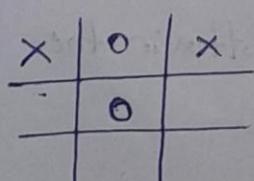

Player X's turn
row : 1

column : 3

Player O's turn
row : 2

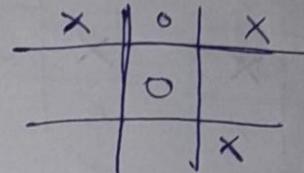

column : 2

Player X's turn

row: 3

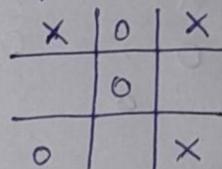

column: 3

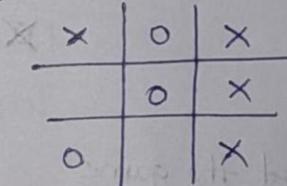

Player O's turn

row: 3

column: 1

Player X's turn

Player X wins!

O is draw

win is 1

Vacuum Cleaner

Lab 2 vacuum cleaner

- Step 1 : consider room A & B : $O(N^2)$
- Step 2 : start the vacuum cleaner implementation
- Step 3 : check if the dirt is present in room A, record the direction, else turn off vacuum cleaner
- Step 4 : ask the user
 - 1: whether to clean the room
 - 2: or stay in the room
 - 3: or move to next room
- Step 5 : if user select 1, then clean the room
 - if user select 2, then stay in the room
 - if user select 3, then move to next room
- Step 6 : repeat from step 3

Cost calculation :

$$O(b^d)$$

$$b = 4$$

$$d = 2$$

$$O(4^2) = O(16)$$

Output

Enter state of A (0 for clean, 1 for dirty) : 1

Enter state of B (0 for clean, 1 for dirty) : 1

Enter location (A or B) : B

Program 2

Implement 8 puzzle problems using Depth First Search (DFS)
Implement Iterative deepening search algorithm

Algorithm:

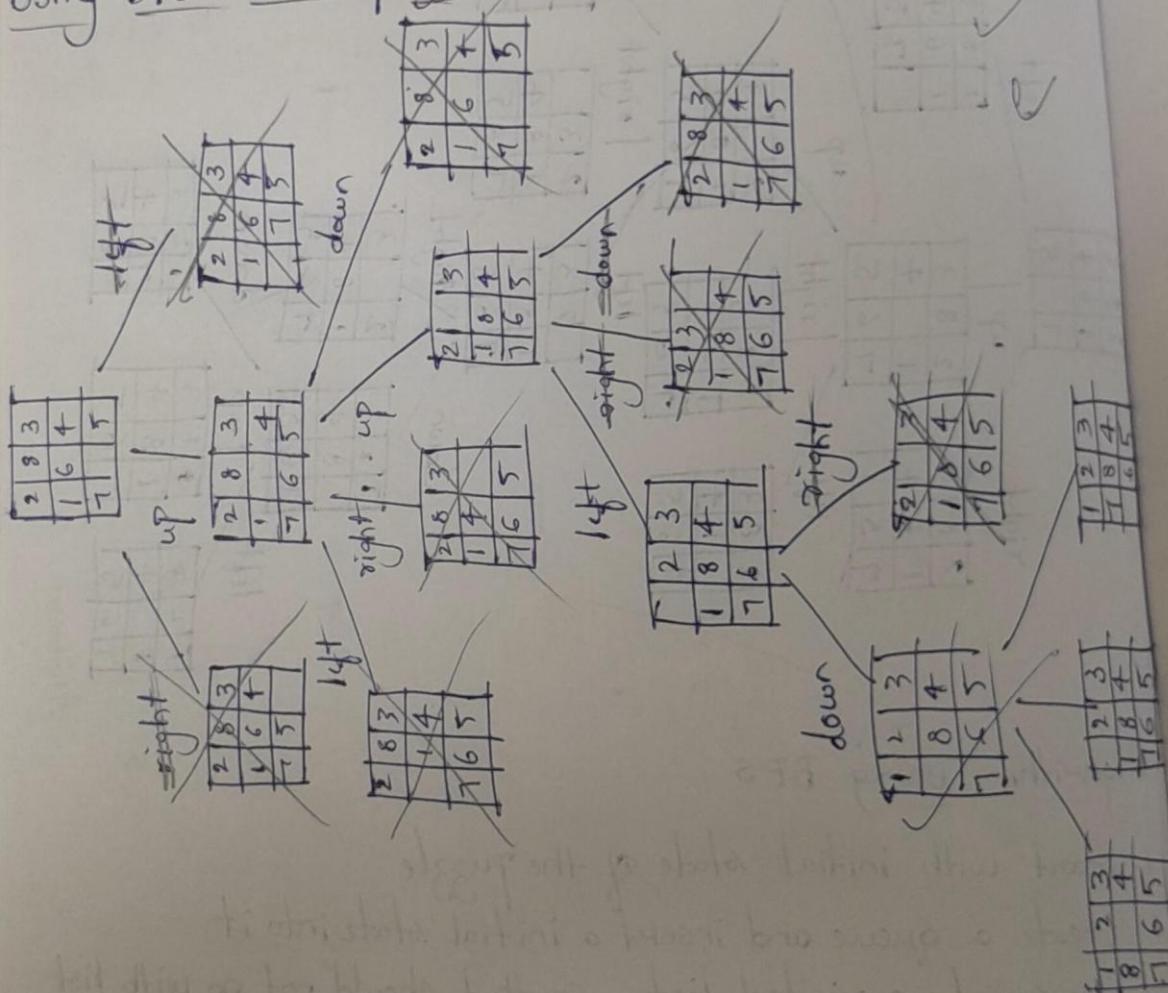

possible → when Q finds empty, no solution
 → stops when goal is found

Algorithm using DFS

1. start
2. Create a stack and push the initial state
3. Create a visited list to track
4. generate all possible next states by moving the blank tile: move up, down, right and left
5. when stack find stops when goal is found
6. stops when stack finds empty

using DFS solve 8 puzzle without heuristic approach

DFS output
solution found in 5 moves:

$\begin{array}{|c|c|c|} \hline 2 & 8 & 3 \\ \hline 1 & 6 & 4 \\ \hline 7 & 0 & 5 \\ \hline \end{array}$ = initial

\downarrow

$\begin{array}{ccc} 2 & 8 & 3 \\ 1 & 0 & 4 \\ 7 & 6 & 5 \end{array}$

\downarrow

$\begin{array}{ccc} 2 & 0 & 3 \\ 1 & 8 & 4 \\ 7 & 6 & 5 \end{array}$

\downarrow

$\begin{array}{ccc} 0 & 2 & 3 \\ 1 & 8 & 4 \\ 7 & 6 & 5 \end{array}$

\downarrow

$\begin{array}{ccc} 1 & 2 & 3 \\ 0 & 8 & 4 \\ 7 & 6 & 5 \end{array}$

\downarrow

$\begin{array}{ccc} 1 & 2 & 3 \\ 8 & 0 & 4 \\ 7 & 6 & 5 \end{array}$

\downarrow

$\begin{array}{|c|c|c|} \hline 1 & 2 & 3 \\ \hline 8 & 0 & 4 \\ \hline 7 & 6 & 5 \\ \hline \end{array}$ = goal

BFS output
solution found in 5 moves

$\begin{array}{|c|c|c|} \hline 2 & 8 & 3 \\ \hline 1 & 6 & 4 \\ \hline 7 & 0 & 5 \\ \hline \end{array}$ = initial

\downarrow

$\begin{array}{ccc} 2 & 8 & 3 \\ 1 & 0 & 4 \\ 7 & 6 & 5 \end{array}$

Iterative Deepening Search (IDS) on Iterative Deepening Depth First Search (IDDFS)

Algorithm

1. Begin by searching for a solution that is 0 moves
2. if not found, search for solutions up to 1 move away
3. if still not found, search up to 2 moves away
4. keep increasing how deep you search until you find the solution

Output:

searching with depth limit = 0

searching with depth limit = 1

solution found in 1 move

Step 0 :

1	2	3
4	0	5
6	7	8

Step 1 :

Program 4

Implement Hill Climbing search algorithm to solve N-Queens problem

Algorithm:

15/09/25 Lab - 5

Implementing Hill climbing search algorithm to solve N-Queens problem

Input : A 4x4 grid with queens at (1,1), (2,3), (3,2), (4,4).

① $(2,2) \leftrightarrow (3,3)$ - ①
 $(1,4) \leftrightarrow (4,1)$ - ②
 $\text{cost} = 2$

② $(2,2) \leftrightarrow (2,4)$ - ①
 $(2,2) \leftrightarrow (3,3)$ - ②
 $(3,3) \leftrightarrow (2,1)$ - ③
 $\text{cost} = 3$

③ $(1,3) \leftrightarrow (2,2)$ - ①
 $(2,2) \leftrightarrow (2,4)$ - ②
 $(1,3) \leftrightarrow (2,4)$ - ③
 $\text{cost} = 3$

④ $(2,4) \leftrightarrow (3,3)$ - ①
 $(3,2) \leftrightarrow (3,1)$ - ②
 $(3,2) \leftrightarrow (4,1)$ - ③
 $\text{cost} = 3$

⑤ $\text{cost} = 0$

Algorithm of hill climbing

- ① start with one queen in each column (initial board)
- ② calculate $\text{cost}(G) = \text{no of attacking queen pairs}$
- ③ for each column move the queen to every other row

and compute next cost.
 choose the move that gives the lowest cost (best neighbour)
 $\text{best cost} < \text{current cost}$, move queen there and
 repeat step 2
 if no neighbour has lowest cost, stop

output:
 initial stack

$\begin{matrix} - \\ - \\ - \end{matrix} \begin{matrix} Q \\ - \\ - \end{matrix}$ cost = 2

$\begin{matrix} - \\ - \\ - \end{matrix} \begin{matrix} Q \\ - \\ - \end{matrix}$

$\begin{matrix} - \\ - \\ - \end{matrix} \begin{matrix} Q \\ - \\ - \end{matrix}$ cost = 2

$\begin{matrix} - \\ - \\ - \end{matrix} \begin{matrix} Q \\ - \\ - \end{matrix}$

The number of queens that are not attacking each other is: 8
```

Program 6

Create a knowledge base using propositional logic and show that the given query entails the knowledge base or not.

Algorithm:

Lab - 6

22/09/25

Propositional Logic
 Implementation of truth table enumeration algorithm for
 deciding propositional entailment.
 i.e., create a knowledge base using propositional logic and
 show that the given query entails the knowledge base or not.
 semantics
 Truth tables for connectives

P	Q	$\neg P$	$P \wedge Q$	$P \vee Q$	$P \Rightarrow Q$
false	false	true	false	false	true
false	true	true	false	true	false
true	false	false	false	true	false
true	true	false	true	true	false

→ and \Rightarrow output

Example: $\alpha = A \vee B$ $\xrightarrow{\text{from}} KB = (A \vee C) \wedge (B \vee \neg C)$

checking that $KB \models \alpha$

A	B	C	$A \vee C$	$B \vee \neg C$	KB	α
false	false	false	false	true	false	false
false	false	true	true	false	false	false
false	true	false	false	true	false	true
false	true	true	true	true	true	true
true	false	false	true	true	true	true
true	false	true	true	false	false	true
true	true	false	true	true	true	true
true	true	true	true	true	true	true

$KB \models \alpha$ holds (KB entails α)

Algorithm

→ List all variables

- Find all the symbols that appear in KB and α
- Example A, B, C

→ Try every possibility

- Each symbol can be True or False

• so we test all combinations (like filling a truth table)

→ check KB

- For each combination, see if KB is true

→ check α

- if KB is true, then α must also be true

- if KB is false, we don't care about α in that

→ Final decision ^{row}

- if in all cases where KB is true, α is also true
→ KB entails α

- if in any case KB is true but α is false →
KB does not entail α

Q. consider S \wedge T as variables and follow relation

$$a : \Gamma \vdash (S \vee T)$$

$$b : (S \wedge T)$$

$$c : T \vee \Gamma \vdash T$$

write truth table and show whether

i) a entails b

ii) a entails c

2	3	4	$\neg T$	$S \vee^a T$	$S \wedge^b T$	$T \vee^c T$
T	T	T	F	T	F	T
D	O	O	F	T	F	T
O	I	I	F	T	F	T
O	O	O	F	T	F	T
I	I	I	F	T	F	T
I	I	I	F	T	F	T

"1" = True
 "0" = False

Answer: a entails b \Rightarrow not holds
 a entails c \Rightarrow holds

Program 7

Implement unification in first order logic
Algorithm:

13/10/25 Lab - 7

Unification Algorithm

Algorithm: unify.

Solve the following

ii) Find Most General Unifier (MGU) of $\{Q(a, g(x, a), f(y))$ and $Q(a, g(f(b), a), x)\}$

Sol $\Rightarrow a = a$
 $g(x, a) = g(f(b), a) \rightarrow x = f(b)$
 $f(y) = x$

~~$\{x / f(b), f(y) / x\}$~~
 $x \rightarrow f(b)$
 $y \rightarrow b$

MGU: $\{x / f(b), y / b\}$

iii) Find MGU of $\{f(f(a), g(y)), f(x, x)\}$

$f(a) = x$
 $g(y) = x$ $\therefore f$ and g are different, so no unifier exists

iv) unify {prime(11) and prime(y)}

$\text{prime}(11) = \text{prime}(y)$
 ~~$y = 11$~~

MGU: $\{y / 11\}$

v) unify: $\{\text{knows}(\text{John}, x), \text{knows}(y, \text{mother}(y))\}$

$$\text{knows}(\text{John}) = y$$

$$y = \text{John} \rightarrow \text{John} = y$$

$$\text{knows}(x) = \text{knows}(\text{mother}(y))$$

$$x = \text{mother}(\text{John})$$

$$x / \text{mother}(\text{John})$$

$$\text{MGu: } \{y / \text{John}, x / \text{mother}(\text{John})\}$$

vi) unify: $\{\text{knows}(\text{John}, x), \text{knows}(y, \text{Bill})\}$

$$\text{knows}(\text{John}) = \text{knows}(y)$$

$$y = \text{John}$$

$$\text{knows}(x) = \text{knows}(\text{Bill})$$

$$x = \text{Bill}$$

$$\text{MGu: } \{y / \text{John}, x / \text{Bill}\}$$

i) Find MGu of $\{p(b, x, f(g(z))) \text{ and } p(z, f(y), f(x))\}$

$$b = z \rightarrow z = b$$

$$x \rightarrow f(y)$$

$$f(g(z)) = f(y) \rightarrow g(z) = y$$

$$\text{MGu: } \{z / b, x / f(y), y / g(z)\}$$

Algorithm

Algorithm: Unify(ψ_1, ψ_2)

Step 1: If ψ_1 or ψ_2 is a variable or constant, then:

a) If ψ_1 or ψ_2 are identical, then return NIL

b) Else if ψ_1 is a variable,

a. then if ψ_1 occurs in ψ_2 , then return FAILURE

- b. Else return $\{\psi_1 / \psi_2\}$
 - c) Else if ψ_2 is a variable,
 - a. If ψ_2 occurs in ψ_1 , then return FAILURE,
 - b. Else return $\{\psi_1 / \psi_2\}$
 - d) Else return FAILURE
- step 2: If the initial Predicate symbol in ψ_1 and ψ_2 are not same, then return FAILURE
- step 3: IF ψ_1 and ψ_2 have a different number of arguments, then return FAILURE
- step 4: set substitution set (SUBST) to NIL
- step 5: For i=1 to the number of elements in ψ_1 ,
- a) call unify function with the ith element of ψ_1 and ith element of ψ_2 , and put the result into s
 - b) If s = failure then returns Failure
 - c) If s \neq NIL then do,
 - a. Apply s to the remainder of both L1 and L2
 - b. SUBST = APPEND(s, SUBST)
- step 6: Return SUBST

output (i)

$$\text{MGu: } \{ 'b': 'z', 'x': ('f', 'y'), 'y': ('g', 'z') \}$$

```

Program 9

Create a knowledge base consisting of first order logic statements and prove the given query using Resolution

Algorithm:

Lab - 9

27/10/25

First Order Logic

create a knowledge base consisting of FOL statements and prove the given query using Resolution

Proof by Resolution

Given KB or Premises

- John likes all kind of food
- Apple and vegetables are food
- Anything anyone eats and not killed is food
- Anil eats peanuts and still alive.
- Harry eats everything that Anil eats
- Anyone who is alive implies not killed
- Anyone who is not killed implies alive

Prove by Resolution that :

John likes peanut

Representation in FOL

- a. $\forall x : \text{food}(x) \rightarrow \text{likes}(\text{John}, x)$
- b. $\text{food}(\text{apple}) \wedge \text{food}(\text{vegetables})$
- c. $\forall x \forall y : \text{eats}(x, y) \wedge \neg \text{killed}(x) \rightarrow \text{food}(y)$
- d. $\text{eats}(\text{Anil}, \text{Peanuts}) \wedge \text{alive}(\text{Anil})$
- e. $\forall x : \text{eats}(\text{Anil}, x) \rightarrow \text{eats}(\text{Harry}, x)$
- f. $\forall x : \neg \text{killed}(x) \rightarrow \text{alive}(x)$
- g. $\forall x : \text{alive}(x) \rightarrow \neg \text{killed}(x)$
- h. $\text{likes}(\text{John}, \text{Peanuts})$

Eliminate implication

- and
- $\forall x \rightarrow \text{food}(x) \vee \text{likes}(\text{John}, x)$
 - $\text{food}(\text{Apple}) \wedge \text{food}(\text{vegetables})$
 - $\forall x \forall y \rightarrow [\text{eats}(x, y) \wedge \neg \text{killed}(x)] \vee \text{food}(y)$
 - $\text{eats}(\text{Anil}, \text{Peanuts}) \wedge \text{alive}(\text{Anil})$
 - $\forall x \rightarrow \text{eats}(\text{Anil}, x) \vee \text{eats}(\text{Harry}, x)$
 - $\forall x \rightarrow [\neg \text{killed}(x)] \vee \text{alive}(x)$
 - $\forall x \rightarrow \text{alive}(x) \vee \neg \text{killed}(x)$
 - $\text{likes}(\text{John}, \text{Peanuts})$

Move negation (\neg) inwards and rewrite

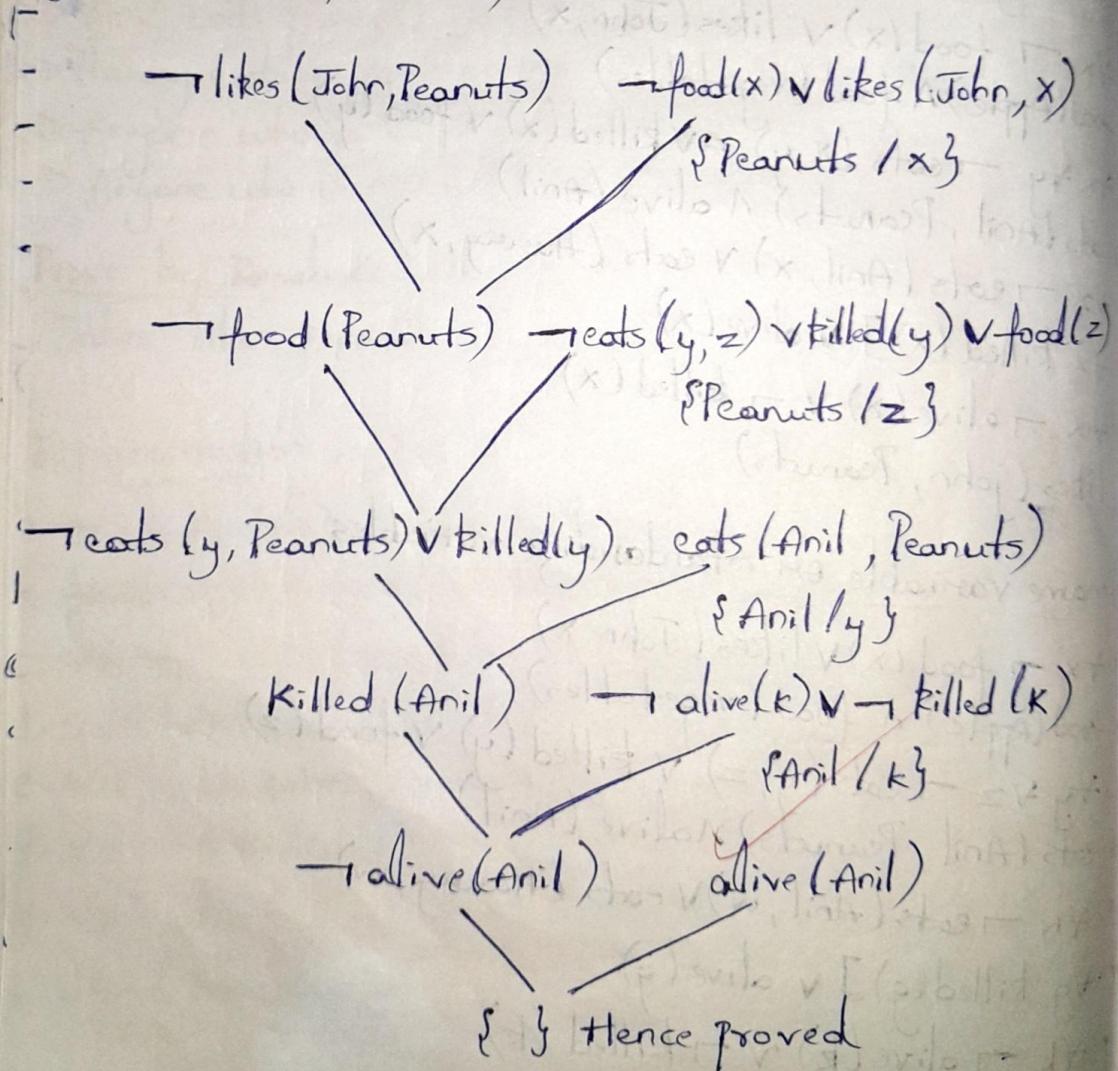

- $\forall x \neg \text{food}(x) \vee \text{likes}(\text{John}, x)$
- $\text{food}(\text{Apple}) \wedge \text{food}(\text{vegetables})$
- $\forall x \forall y \rightarrow \text{eats}(x, y) \wedge \neg \text{killed}(x) \vee \text{food}(y)$
- $\text{eats}(\text{Anil}, \text{Peanuts}) \wedge \text{alive}(\text{Anil})$
- $\forall x \rightarrow \text{eats}(\text{Anil}, x) \vee \text{eats}(\text{Harry}, x)$
- $\forall x \neg \text{killed}(x) \vee \text{alive}(x)$
- $\forall x \neg \text{alive}(x) \vee \neg \text{killed}(x)$
- $\text{likes}(\text{John}, \text{Peanuts})$

Rename variable or standardize variables

- $\forall x \neg \text{food}(x) \vee \text{likes}(\text{John}, x)$
- $\text{food}(\text{Apple}) \wedge \text{food}(\text{vegetables})$
- ~~$\forall y \forall z \neg \text{eats}(y, z) \vee \text{killed}(y) \vee \text{food}(z)$~~
- $\text{eats}(\text{Anil}, \text{Peanuts}) \wedge \text{alive}(\text{Anil})$
- $\forall w \rightarrow \text{eats}(\text{Anil}, w) \vee \text{eats}(\text{Harry}, w)$
- $\forall g \neg \text{killed}(g) \vee \text{alive}(g)$
- $\forall k \neg \text{alive}(k) \vee \neg \text{killed}(k)$
- $\text{likes}(\text{John}, \text{Peanuts})$

• Drop universe

- a. $\neg \text{food}(x) \vee \text{likes}(\text{John}, x)$
- b. $\text{food}(\text{apple})$
- c. $\text{food}(\text{vegetables})$
- d. $\neg \text{eats}(y, z) \vee \text{killed}(y) \vee \text{food}(z)$
- e. $\text{eats}(\text{Anil}, \text{Peanuts})$
- f. $\text{alive}(\text{Anil})$
- g. $\neg \text{eats}(\text{Anil}, w) \vee \text{eats}(\text{Harvey}, w)$
- h. $\text{killed}(g) \vee \text{alive}(g)$
- i. $\neg \text{alive}(k) \vee \neg \text{killed}(k)$
- j. $\text{likes}(\text{John}, \text{Peanuts})$

Algorithm

1. Input:
 - Knowledge Base (KB)
 - Query (φ)

2. Convert KB and $\neg\varphi$ to clausal form:

- Eliminate implications
- Move negations inward
- Standardize variables
- Skolemize (remove \exists quantifiers)
- Drop universal quantifiers
- Convert to CNF.

3. Apply Resolution:

- Repeatedly resolve pairs of clauses that contain complementary literals
- Add new clauses to the KB
- Stop if:
 - Empty clause (\perp) is derived $\rightarrow \varphi$ is false
 - No new clauses can be added $\rightarrow \varphi$ is True

4. Output True/False for Query φ

$\frac{A}{B}$
 $\frac{C}{D}$

Code:

```
from itertools import combinations
```

```
def get_clauses():

    n = int(input("Enter number of clauses in Knowledge Base: "))

    clauses = []

    for i in range(n):

        clause = input(f'Enter clause {i+1}: ')

        clause_set = set(clause.replace(" ", "").split("v"))

        clauses.append(clause_set)

    return clauses
```

```
def resolve(ci, cj):

    resolvents = []

    for di in ci:

        for dj in cj:

            if di == ('~' + dj) or dj == ('~' + di):

                new_clause = (ci - {di}) | (cj - {dj})

                resolvents.append(new_clause)

    return resolvents
```

```
def resolution_algorithm(kb, query):

    kb.append(set(['~' + query]))

    derived = []

    clause_id = {frozenset(c): f'C{i+1}' for i, c in enumerate(kb)}
```

```
step = 1

while True:

Program 10

Implement Alpha-Beta Pruning.

Algorithm:

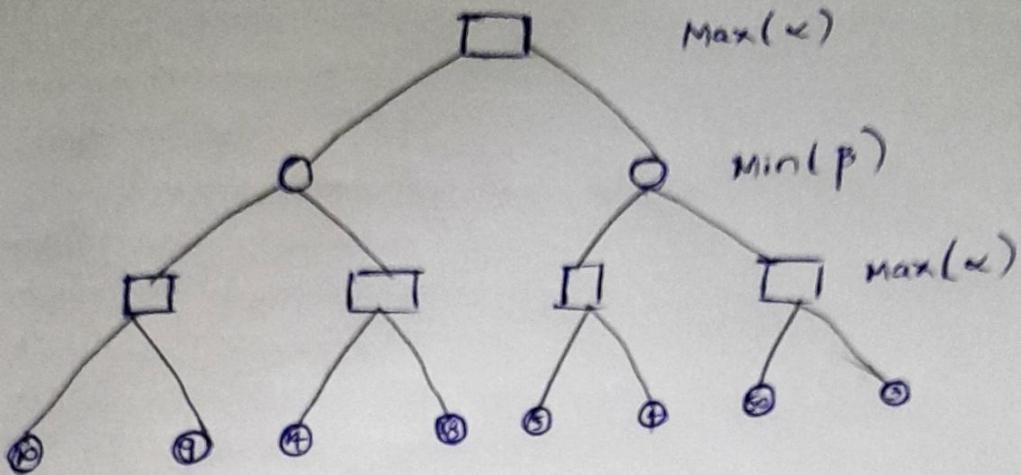

27/10/25 Lab 10

Adversarial search Implement Alpha-Beta Pruning

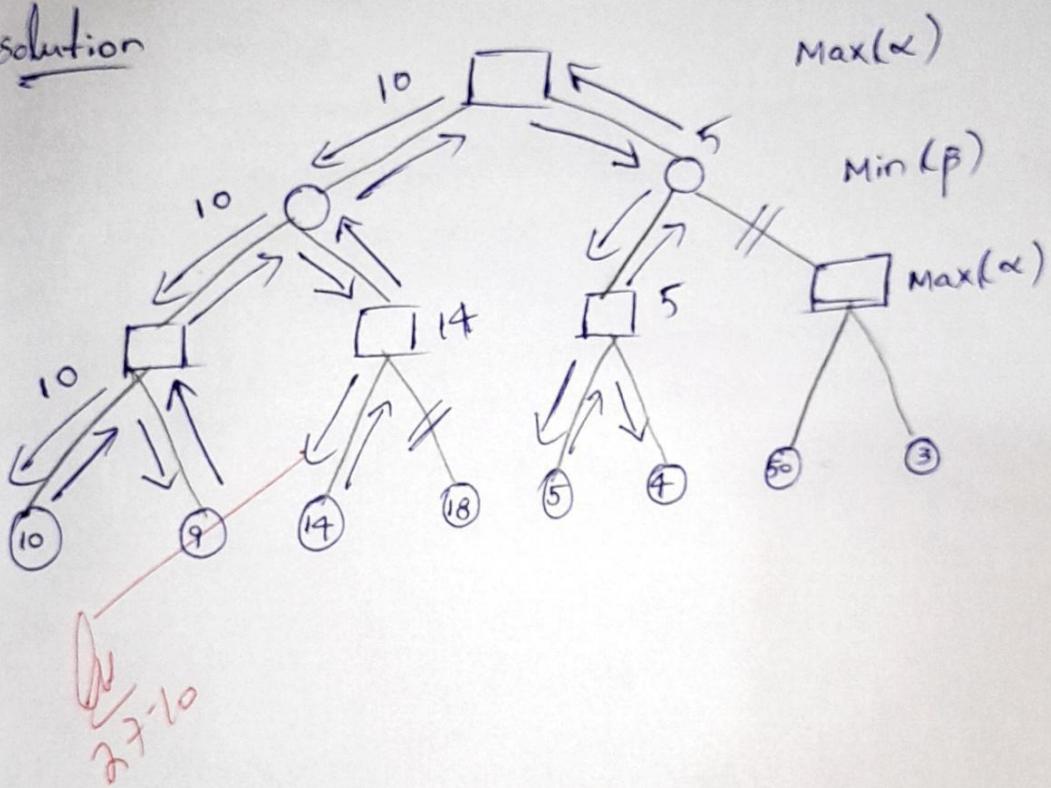

Algorithm

- f first i. start at the root node (current game board)
- c the current player is either Max or min
- 1a. Initialize
 - i. $\alpha = -\infty$
 - ii. $\beta = +\infty$
- 1b. If terminal node (end of game):
 - return the utility (score) of that node
2. If its a Max player:
 - set value = $-\infty$
 - For each child of this node:
 - 1) compute child-value = $\text{AlphaBeta}(\text{child}, \text{depth}-1, \alpha, \beta, \text{False})$
 - 2) update value = $\max(\text{value}, \text{child-value})$
 - 3) update $\alpha = \max(\text{value}, \text{child-value})$
 - 4) if $\alpha \geq \beta$, then break → (prune remaining branches)
 - Return value
3. If its a Min player:
 - set value = $+\infty$
 - For each child-value =
 - 1) $\text{AlphaBeta}(\text{child}, \text{depth}-1, \alpha, \beta, \text{True})$
 - 2) update value = $\min(\text{value}, \text{child-value})$
 - 3) update $\beta = \min(\beta, \text{value})$

- 4) if $\alpha \geq \beta$, then break \rightarrow (prune remaining branches)
- return value

Solution

Code:

class Node:

```
def __init__(self, name):
    self.name = name
    self.children = []
    self.value = None
    self.pruned = False
```

def alpha_beta(node, depth, maximizing, values, alpha, beta, index):

Terminal node

if depth == 3:

```
    node.value = values[index[0]]
    index[0] += 1
    return node.value
```

if maximizing:

best = float('-inf')

for i in range(2): # 2 children

```
        child = Node(f'{node.name} {i}')
        node.children.append(child)
```

```
        val = alpha_beta(child, depth + 1, False, values, alpha, beta, index)
```

```
        best = max(best, val)
```

```
        alpha = max(alpha, best)
```

if beta <= alpha:

```
            node.pruned = True
```

```
            break
```

```
    node.value = best
```

```
    return best
```

else:

```
    best = float('inf')
```

```
